

# Stabilizing Shell with Python

Step 1:

```
python3 -c 'import pty;pty.spawn("/bin/bash")'
```

OR

```
python2 -c 'import pty;pty.spawn("/bin/bash")'
```

OR

```
python -c 'import pty;pty.spawn("/bin/bash")'
```

Step 2:

```
export TERM=xterm
```

Step 3:

CTRL + Z to background the shell

Step 4:

```
stty raw -echo; fg
```

Note: If the shell dies, any input in your own terminal will not be visible (as a result of having disabled terminal echo). To fix this, type **reset** and press ENTER.
